Tampons Gr. Super SafetyTop[®], Sensity[®], SoftSilk[®] and
Tampons Gr. Super Plus SafetyTop[®], Sensity[®], SoftSilk[®]**

Clinical application study under dermatological and gynaecological control

The test product was applied during a period of eight weeks during two menstrual cycles by 20 subjects several times a day onto the intimate area. From the clinical-dermatological and specialist point of view, no relevant skin reactions occurred in the test area; the product was tolerated

very well.

Neither intolerance reactions suggestive of irritation nor allergic reactions (contact dermatitis) were detected. Patch testing according to international guidelines after the end of the application period confirms that no test person has been sensitised by the product. Accordingly, from the dermatological viewpoint, there is no high potential for irritation and sensitisation for the tested product when this is used as intended.
